Issues

1. Is laser scan data suitable for the automatic landmarking methods we will develop?
2. Should the data from different schizophrenic types and locations be regarded as homogeneous or not?
3. Are age and sex available for all images?
4. The Glasgow controls will be asked about history of cleft lip, facial surgery and psychiatric illness. Is this information available on the Irish controls?
5. Do we need other medical information on the schizophrenic and orthognathic cases?
